

“I would like to thank the IES Brain Research Foundation for sponsoring Emma Farley's summer research in my laboratory. Thanks to the Foundation's high standards for selection of Fellows, Emma is an extremely bright and motivated student. She completed her research project successfully by generating and characterizing nine phosphorylation-site mutants of mGluR5, a glutamate receptor related to the etiology of Parkinson's disease. This summer fellowship allowed Emma to get professional training in my laboratory, which will be beneficial for her career development. In the meantime, my lab members and I really enjoyed working with Emma and were affected by her enthusiasm to learn. The contribution and goals of IES Brain Research Foundation are all the more important to investigators and students committed to biomedical research. I wish the Foundation increasing success in your effort to encourage exceptional students to explore neuroscientific research as a career choice. “

**Yours sincerely,
Paul Greengard**
